

DP-600 — OneLake Architecture, Shortcuts & File View

10 Important Questions — Answer Review

Q1. OneLake Architecture

A company has four Fabric workspaces, each containing multiple Lakehouses. The organization wants analysts to access data across these Lakehouses without requiring each team to maintain an independent enterprise data lake. Which statement BEST describes how OneLake addresses this requirement?

Answer: D. OneLake replaces workspaces and requires all Lakehouses to be created within a single workspace.

Correct Answer: B. OneLake provides a unified logical storage layer for Fabric, allowing Fabric items to work with data through a common data-lake architecture.

Result: Incorrect

Explanation: Incorrect — OneLake does not replace workspaces.

Q2. Shortcut vs Copy

A team has 20 TB of sales data in an existing ADLS Gen2 account and wants to analyze it from a Fabric Lakehouse without creating another physical copy. What should the team use?

Answer: B. Create a OneLake shortcut that references the existing data.

Correct Answer: B. Create a OneLake shortcut that references the existing data.

Result: Correct

Explanation: Correct — a shortcut references existing data.

Q3. Shortcut Trap

A shortcut appears inside a Lakehouse Files area. A developer claims Fabric has therefore copied the source files into the Lakehouse. Which response is MOST accurate?

Answer: C. Incorrect. A shortcut provides a reference to the existing data location rather than requiring the data itself to be duplicated.

Correct Answer: C. Incorrect. A shortcut provides a reference to the existing data location rather than requiring the data itself to be duplicated.

Result: Correct

Explanation: Correct — appearance in Files does not mean the data was copied.

Q4. Regions

A Fabric capacity is associated with a particular Azure region. Which statement about OneLake and geographic placement is MOST appropriate?

Answer: D. OneLake automatically moves all organizational data to the nearest Azure region whenever a user accesses it.

Correct Answer: C. Fabric's regional architecture matters for considerations such as data location and residency, even though OneLake provides a unified logical data-lake experience.

Result: Incorrect

Explanation: Incorrect — OneLake does not automatically move all data to the nearest region.

Q5. File View

A data engineer wants to visually browse folders and files directly from the Fabric Lakehouse interface. Which capability should be used?

Answer: B. File view

Correct Answer: B. File view

Result: Correct

Explanation: Correct — File view is used to browse Lakehouse files and folders.

Q6. Architecture Decision

Sales, customer, and product data already exists in external ADLS Gen2. Three Fabric teams need the same data, and management does not want three separate copies. Which design is BEST aligned with OneLake shortcuts?

Answer: C. Use shortcuts so Fabric items can reference the existing data without unnecessary duplication.

Correct Answer: C. Use shortcuts so Fabric items can reference the existing data without unnecessary duplication.

Result: Correct

Explanation: Correct — this avoids unnecessary duplication.

Q7. OneLake File Explorer

An analyst wants to work with OneLake content through the familiar Windows File Explorer experience. Which statement is BEST?

Answer: Not answered.

Correct Answer: B. OneLake File Explorer provides a Windows-based way to browse and work with OneLake content; it is an optional client application.

Result: Not answered

Explanation: Not answered — review the optional Windows experience.

Q8. Files and Tables

A developer claims Files and Tables in a Fabric Lakehouse are exactly the same storage area. Which answer BEST corrects this?

Answer: B. Incorrect; Files is used for file-based data organization, while Tables provides the structured table area of a Lakehouse.

Correct Answer: B. Incorrect; Files is used for file-based data organization, while Tables provides the structured table area of a Lakehouse.

Result: Correct

Explanation: Correct — Files and Tables have different purposes.

Q9. Shortcut + Folder Structure

External sales data already exists in ADLS Gen2. Management says not to duplicate it merely to make it accessible from the Lakehouse. Which implementation BEST satisfies the requirement?

Answer: B. Create external-sales as a shortcut to the appropriate external data location while maintaining raw and processed as normal Lakehouse folders.

Correct Answer: B. Create external-sales as a shortcut to the appropriate external data location while maintaining raw and processed as normal Lakehouse folders.

Result: Correct

Explanation: Correct — use a shortcut for the external data.

Q10. Integrated Scenario

Consider: (1) OneLake provides a unified logical data-lake foundation. (2) A shortcut is primarily used to create another physical copy. (3) Fabric region can matter for data location and residency. (4) OneLake File Explorer is an optional Windows experience. Which combination contains only correct claims?

Answer: D. Claims 1, 2, 3, and 4

Correct Answer: B. Claims 1, 3, and 4 only

Result: Incorrect

Explanation: Incorrect — claim 2 is false because a shortcut references existing data rather than primarily creating a copy.

Final Report — Where Improvements Are Needed

Topic	Finding	Improvement Needed
OneLake architecture	Q1 ■	Understand OneLake as a unified logical storage layer. It does not replace workspaces.
Shortcuts	Q2, Q3, Q6, Q9 ■; Q10 ■	Strong area. Remember: shortcut = reference to existing data, not a physical copy.
Regions	Q4 ■	Review regional architecture, data location, and residency. Do not assume automatic movement to the nearest region.
File View	Q5 ■	Good understanding. File view lets you browse Lakehouse files and folders in Fabric.
OneLake File Explorer	Q7 —	Learn that it is the optional Windows experience for interacting with OneLake content.
Files vs Tables	Q8 ■	Good understanding of the distinct Lakehouse Files and Tables areas.

Performance: 6 correct out of 9 answered = 66.7% accuracy. Q7 was not answered.

Priority revision: OneLake architecture → Regions → OneLake File Explorer. Shortcut concepts are comparatively strong.

Core memory: OneLake = unified logical storage layer. Shortcut = reference, not copy. File View = browse Lakehouse files in Fabric. OneLake File Explorer = optional Windows access.
