

Microsoft Fabric — Prepare Data

Mock Exam Report · Version 1 · 25 Questions

Score	Percentage	Result
23 / 25	92%	Strong pass

Accuracy by section

Section	Questions	Correct	Accuracy
A — Get Data	1-8	6 / 8	75%
B — Transform Data	9-20	12 / 12	100%
C — Query & Analyze Data	21-25	5 / 5	100%

Section A (Get Data) is the only weak spot — both missed questions fall here. Transform Data and Query & Analyze Data are fully solid.

Mistake log

Q#	Topic	Your answer	Correct	Mistake type
Q4	Shortcuts vs. other Get Data objects	C — Stored procedure	B — Shortcut	Conceptual
Q8	OneLake integration with semantic models	D — DAX calculated column	A — OneLake integration	Conceptual

Both mistakes are conceptual mix-ups rather than careless slips: in Q4 a data-referencing object (Shortcut) was confused with a database code object (Stored procedure); in Q8 a data-access mechanism (OneLake integration) was confused with a semantic-model modeling feature (DAX calculated column). This points to one underlying gap rather than two unrelated ones — see below.

Topic tracking

Status	Topic
Strong	Transform Data — filtering, aggregation, joins, unions, dedup, null handling, type conversion, denormalization,
Strong	Query & Analyze Data — Visual Query Editor filters, SQL GROUP BY, KQL for Eventhouse, DAX SUM measur
Needs practice	Get Data — distinguishing Shortcuts, data ingestion pipelines, and stored procedures as different object types
Priority	Get Data — OneLake integration as the mechanism semantic models use to read OneLake data without duplic

Exact topics to revise before the next test

- Re-read the definitions of Shortcut, data ingestion pipeline, and stored procedure side by side — focus on what each one physically does (reference vs. copy vs. execute logic).
- Review how a Power BI semantic model connects to OneLake data via OneLake integration, and how that differs from DAX-side features like calculated columns.
- No other sections need revision right now — Transform Data and Query & Analyze Data are both at 100%.

Suggested next steps: a short 5-question targeted mini-test on Get Data object types (Shortcuts, pipelines, stored procedures, OneLake integration), then a full retake of Version 1 or a fresh Version 2 mock paper once that gap is closed.
